Sowing Direction

(19) To stop the germination inhibition give seeds a warm compost (about +22 °C) [about 72 °F] with constant humidity for at least 6 weeks. Then keep cold (–4 to +4 °C) [25 to 39 °F] for 6–8 weeks. Usually, the germination starts at +4 °C [39 °F]. Raise temperatures gradually up to +10 °C [50 °F] until germination is completed. If the warm or cold period was not long enough the seeds will not germinate until the following year. They will then need another warm period (summer) and a cold period (winter). Well-known examples: Cimicifuga and Helleborus.

Scheduling**Sowing Time Hint**

For best results sow after harvest, approx. July.
